

(a) Controller requests and low-value decision

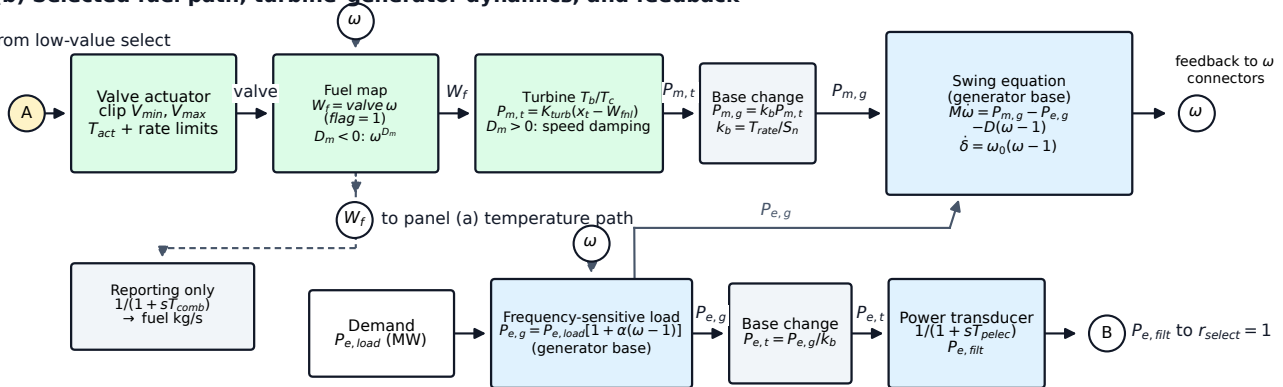

Speed / power

$r_{select} = -2$ (governor-output feedback) is solved algebraically in closed form. Dashed feedback denotes implementation-specific back-calculation.

(b) Selected fuel path, turbine-generator dynamics, and feedback

from low-value select

Bases: governor, valve, W_f , and $P_{m,t}$ use turbine base T_{rate} ; $P_{e,g}$ and the swing equation use generator base S_n .

Inactive subset: K_{dgov}/T_{dgov} , deadband, outer MW loop, R_{up}/R_{down} , and T_{eng} .
